

230 VAC UPS for sectional door operation

This comfort UPS is used for operating e.g. a sectional door controller (230 VAC single phase)

It is installed between the existing mains power output and the door controller.

In case of a power failure, the product goes into standby mode (no lights on the front).

When the turn switch on the lid is activated, the UPS starts up and provides 230 VAC to the door controller. It may also provide the controller an “open” signal. After 3 minutes the UPS returns into standby mode (can be reset).

- Green light indicates that mains power is available
- Yellow light indicates the output from the UPS is available
- Auto shutdown in the event of mains failure (no light)
- 230 VAC - 2000VA -1400W
- Pure sinewave output making it perfect for supporting critical loads
